

Internal DNS Orchestration (Sophos VM 201)

Sophos acts as the primary network gateway (10.0.0.1) and local DNS resolver.

Split-Horizon DNS Configuration

Split-Horizon forces local devices to route traffic directly to the internal Nginx Proxy (10.0.1.111), completely bypassing the internet and Cloudflare Tunnels.

Benefits:

1. **Jellyfin:** Streams media locally at full switch speeds (1 Gbps) without consuming WAN bandwidth.
2. **Home Assistant:** Provides secure, LAN-only access using standard domain names (ha.domain.local).

Setup Steps (Sophos Web GUI)

1. Log into Sophos at <https://10.0.0.1>.
2. Navigate to **Network > DNS**.
3. Under **DNS Host Entries**, click **Add** to create the following records:

Host Name	IP Address	Routing Result
media.domain.local	10.0.1.111	Re-routes Jellyfin traffic to internal proxy
ha.domain.local	10.0.1.111	Routes internal Home Assistant traffic to proxy

Note: All domain entries must point to 10.0.1.111 (Nginx), not the specific container IP. Nginx is responsible for looking at the domain name and forwarding it to 10.0.0.4 or 10.0.1.109.
